INSTRUCTIONS FOR SEMEN SPECIMEN COLLECTION

NAME _____

DATE OF BIRTH: _____

PHYSICIAN _____

COLLECTION DATE _____

COLLECTION TIME _____

POST-VASECTOMY SCREEN

COMPLETE SEMEN ANALYSIS

POST-VASECTOMY SCREEN: At least six ejaculations are needed for spermatozoa to clear from the semen after vasectomy. Collect the specimen after this period of time as instructed by the doctor. The collection container should be a sterile specimen container supplied by the laboratory or physician’s office.

COMPLETE SEMEN ANALYSIS: A 2-7day abstinence period is necessary for this test. The Seminal Fluid Collection kit supplied by the laboratory should be used.

COLLECTION METHODS:

1. The specimen can be obtained by masturbation and ejaculated directly into the specimen container. Collect the entire specimen avoiding spillage. If any of the specimen is spilled, label the sample container as **Incomplete Specimen.**
2. The sample can be obtained through intercourse if the non-spermicidal polyurethane condom provided in the Seminal Fluid Collection Kit is used. Other condoms are not acceptable because they often contain spermicidal lubricants and powders. **NOTE: Contraceptive solutions and lubricants cannot be used.**

The sample must be maintained at a temperature between room and body temperature until it is submitted. Keep the sample close to your body to keep it warm. **Label the specimen container with the patient’s name, date of birth, and date and time of collection.**

SPECIMEN DELIVERY:

Note: specimens arriving in the lab outside of the acceptable times will be rejected

For complete semen analysis, complete the information below and submit it with specimen.

1. What time was the specimen collected? _____
2. Was any of the specimen spilled? _____ If so, when? _____
3. Method of sample collection: masturbation intercourse using Seminal Fluid Collection Kit
4. Number of days of abstinence _____
5. Was the specimen maintained between room & body temperature before it was submitted?
 Yes: _____ No: _____
